

Key Decisions from the Meeting

1. Stop overthinking acquisition item mapping. The old code's `acq_expenses_to_keep` filter (the 8-item override) is being abandoned. Just sum all "A" items as finance labels them. Maryam and Stephanie both said: follow whatever finance defines. Don't second-guess their categories.

2. No new/renewal split needed. The 2026 file doesn't have it, so use the same ratio for both new and renewal. This simplifies things massively.

3. Need to include Other Property + Other Auto columns too — not just Other Specialty. You were only summing one column. Stephanie pointed out the 2026 Excel has multiple "Other" columns. This likely explains the overhead gap (your 5% vs old ~14%).

4. The implementation path is a preprocessed file swap. Stephanie suggested: manually build a new version of `p.processed_expense_all` with the 2026 ratios, modify the join key from "other" (line text) to numeric line codes (016, 032, 072, etc.), and run the existing LTV pipeline. Minimal code change — just the join variable and the preprocessed parquet.

5. Commissions stay separate. Don't mix them in. Maryam's team (home LTV) already modified their pipeline to handle commissions separately — ask her for the PR/code diff.

6. Claims and Marketing are straightforward — one row each from the 2026 file.

Your Next Steps

Immediate (today/tomorrow):

- Redo the SUMIF calculation adding Other Property + Other Auto columns
- Produce ratios by numeric line (not just total) for all 5 categories: A, L, O, Claims, Advertising
- Divide each by earned premium to get per-line ratios

This week:

- Manually build the new preprocessed expense parquet matching the old format (channel × line), replicating each ratio 6 times (3 channels × 2 N/R) since we lost those dimensions
- Modify the join key in `join_prem_with_expenses` from text line to numeric line codes
- Run the pipeline with the swapped file, get new LTV numbers
- Calculate the delta (old LTV minus new LTV) — that's the material for finance's decision

Waiting on:

- Maryam's commission PR/code diff to replicate for SPL
